impero
ed admin

Impero EdAdmin is our powerful and scalable cloud-based network management module for managing devices across single or multiple school sites. It includes an administrator's dashboard, with details on device and user activity in a single view. Completely customisable, **Impero EdAdmin** provides an intuitive search bar which remembers your top searches, while enabling technical teams to personalise their dashboard.

The key features

Remote control and support

Providing technical teams with remote access to devices (across multiple school sites) to identify and resolve issues, so resources remain functional and up-to-date, minimising disruption for teachers and students alike.
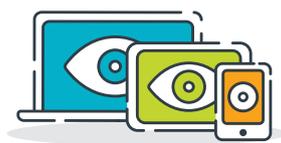

Multi-site management

Supporting multi-site establishments with the ability to oversee users and devices across multiple school networks (across disparate locations) and report on network utilisation at an individual or group level with secure permissions-based access for technical staff.

Four-eyes authentication

Introducing a new level of security for users who handle sensitive data and requiring confirmation by a second user for any authorisation.

Inventory management

Automating inventory checks and collecting data through a single view helps to highlight the specification of equipment, so it can be replaced, refreshed or removed no sooner, or later, than is necessary.

Utilisation reporting

Compiling real-time data on all devices in a visual dashboard to provide a complete view of all usage across the network, including software applications and website activity.

Power management

Centralising the control of power usage across the network, scheduling remote power on/off, detecting idle time and delivering comparative reports to maintain efficiency and track savings.

Tech tools

Enabling admin staff to remotely perform a series of technical tasks on one or multiple devices with escalated privileges, and without the need to log the users out.

Real-time monitoring

Monitoring all devices on a network to identify misuse or inappropriate behaviour and to observe technical issues as they occur.

Technical issue flags

Enabling admin users to utilise bespoke keyword libraries to detect technical issues as they occur and record the screen to help diagnosis.

The key benefits

Save time
Automating several tasks and processes (including scheduled powering on/off devices, pushing software updates to multiple devices, and general device and network maintenance) reduces manual processes, saving masses of time for school technical teams.

Ensure security
Managing access with four-eyes authentication, preventing and establishing the origin of network threats and enforcing school or network-wide policies, helps technical teams to maximise the security of their network.

Improve efficiency
A suite of admin tools enables technical teams to manage users and devices across multiple schools efficiently, streamlining several processes, while the remote control functionality enables technical issues to be resolved across one or multiple sites with ease.

Optimise performance
Detailed reports on the state of hardware (and identification of resources which require maintenance or need replacing) helps to optimise general performance of devices. Sophisticated monitoring tools help to identify technical issues across the network, with a log of key details, enabling technical teams to diagnose faults effectively.

Enhance digital learning
Remote control features ensure equipment is functioning correctly across individual or multiple school sites, reducing disruptive downtime for staff and students alike and contributing to a better digital learning environment.

Save money
The cost of running a busy network can be dramatically reduced by controlling power to reduce energy and by consolidating a range of network admin tools into a single solution (removing numerous support contracts and renewals). Utilisation reporting then ensures you are getting the most from the devices and licences that you own.

impero education pro

As part of Impero Education Pro

Impero EdAdmin can be purchased standalone or as part of the suite, for a more comprehensive approach to device monitoring and management. Deployed as part of **Impero Education Pro**, **Impero EdAdmin** fully integrates with **Impero EdTeach** and **Impero EdProtect** so that classroom control and online safety form an all-inclusive network administration strategy that can be can be managed centrally.

impero patch

Customise with add-ons

Impero Patch uses automated detection to identify, download and deploy critical patches for a significant number of applications used by teachers and learners on a daily basis, ensuring proper preventive measures are taken against potential threats.
